

Farmulti® method potentiates efficiency of lectures, trainings and mastering of any know-how. If a complicated or extensive problem in area of personal growth or interpersonal communication makes you get stuck, the teacher transfers the problem just by farmulti method into many (=multi) remote (=far) science disciplines.

He transfers a problem from psychology or management into maths, economy, history, linguistics, medicine. There, he resolves it smartly and elegantly, because remote disciplines have another solving apparatus with surprisingly wide possibilities. Then, the teacher returns the matter into psychology, into human relations again. Here, the using of results is our daily routine and daily need. And you, his students, can use it all with a great advantage. Of course, the teacher must be highly skilled in various disciplines. Using the farmulti method is exacting for him. However, the whole process isn't complicated for students. The "dirty transferring a retransferring work" is done in the teacher's mind. One course led by farmulti method can save you many other courses in the same areas. Or, what's better, you can gain more from all next courses in your life, using the farmulti know-how.

Everybody knows the positive effect of analogy and examples in a convincing speech. Farmulti method represents a potentiated analogy and examples - it is a new quality in this area.

PMF

Probably the most interesting product and consequence of farmulti method are psychomathematical formulas (=PMF)

There are principles of human behavior and handling, which have general force of mathematical formulae. However, they are valid in psychology - in communication, in work with information, in emotion management. In a Gruber's course, you needn't chew over dozens of difficult interpersonal situations - you make friends with a relevant mental formula. And you develop (or derive) optimum solution of not only all of them, but of all the future situations that can occur in your life.

Using psychomathematical formulas, you gain a professor's horizon in the problem. Using psychomathematical formulas, you have not only caught one fish - you have got the know-how to catch fish forever.

New concept and word for psychomathematical formulas is "multimethod".

Practical examples of psychomathematical formulas (PMF):

PMF "Opposition of Subconscious",

PMF "Psychical Relativity Theory",

PMF "Professional Concentration",

PMF "Self-fulfillment and Connection"

Etc.

More about it in Gruber's books and courses.
